

# Developer Code Challenge

## Overview

We love ice cream! Tell us what the top five ice cream shops in Alpharetta are and why.

## Requirements

- place your code in a GitHub repo that we can clone and run
- use JavaScript
- use the Yelp Fusion API
- output should include
  - business name
  - business address (street, city)
  - excerpt from a review of that business
  - name of the person that wrote the review
  - business information should be output in the order received from the API response

## What We're Looking For

What's your style? How do you approach this project? Do you bang it out in 20 lines and console logs or do you code an elaborate dance among the asynchronous jungle to deliver a symphony? Expect that the phone interview will involve talking about the choices you made.

## Tabs or spaces?

***How do you want the output to look*** - if you have a lot of time and want to show off your CSS/HTML skills give us a create-react-app repo with a full front end. Have less time? console.log out that data - this isn't about scoring bonus points with us, it's about showing us you know the bare minimum and giving us something to chat about during the subsequent phone interview.

***How long will this take*** - that totally depends on you. We think an estimate for something that matches the requirements above will be about 45 - 60 minutes. Doing above and beyond is on you.

***Can I use NPM repos*** - if that's what you'd like to do - have at it; just be ready to explain why you chose one repo over another or why you used one at all.

## Yelp Fusion API

Here is your starting point - <https://www.yelp.com/fusion> - sign up and use of the API is free.

If you have questions - please feel free to reach out to us through the recruiter and ask! We're a collaborative team and would be happy to discuss the challenge and clarify anything for you.
